If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: _____

Inventors (please provide full names): _____ *please see the attachment*

Earliest Priority Filing Date: _____

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

*please search for resin of the general formula (1),
 especially with the elected resin.*

Thank you.

RESPONSE

Mail Stop Amendment
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

October 12, 2004

Sir:

The Office Action mailed September 10, 2004, in connection with the above-identified application, is noted. In this Office Action mailed September 10, 2004, the Examiner has required an election of a single disclosed chemical structure species for the general formula (1) set forth in claim 1, for initiation of a search. In connection therewith, the Examiner has required Applicant "to precisely disclose the elected chemical structure with (1) all bonding connections between and among all chemical ingredients and (2) listing of all chemical elements and their positions in the elected chemical structure".

In response thereto, and thus as the species elected, represented by the general formula (1) of claim 1, the following polymer (heat-resistant polymer (I)) is elected:

Elected polymer

1270.43264X00

It is respectfully submitted that the foregoing structural formula provides all bonding connections between and among all chemical ingredients, and qualifies as a listing of all chemical elements and their positions in the elected chemical structure. Accordingly, it is respectfully submitted that the above-indicated heat-resistant polymer (I), being elected in response to the Office Action mailed September 10, 2004, provides a complete response thereto.

The indication by the Examiner that no restriction requirement is being made, in the Office Action mailed September 10, 2004, is noted. It is also to be noted that the Examiner has indicated that when claim 1 is found to be allowable over prior art, claims directed to a process for forming a relief pattern (claim 11) and to an electronic component or device (claims 12 and 13) will be allowed in the present application. It is respectfully submitted that there is no need for Applicant to respond to contentions by the Examiner in Item E on page 3 of the Office Action mailed September 10, 2004.

As an aside, statements by the Examiner in Item E on page 3 of the Office Action mailed September 10, 2004, are noted. In particular, it is noted that the Examiner initially refers to species, but in the last sentence in Item E states that in the absence of convincing evidence, the "restriction" would not be removed. It is respectfully submitted, however, that no restriction requirement has been made in the Office Action mailed September 10, 2004. Note Item D on page 3 of

the Office Action mailed September 10, 2004. It is respectfully requested that the Examiner clarify the record, and indicate that the "election-of-species" requirement would not be removed in "the absence of convincing evidence", if this is the intent of Item E on page 3 of the Office Action mailed September 10, 2004.

In view of all of the foregoing, Applicant respectfully elects the above-indicated species of heat-resistant polymer (I) "for a precise consideration and search", and respectfully requests examination of the above-identified application on the merits in due course. Upon allowance of subject matter including the above-indicated species, examination of the composition including the heat-resistant polymer represented by general formula (1), and consideration and allowance of all claims presently in the application, are respectfully requested.

Please charge any shortage in fees due in connection with the filing of this paper, including extension of time fees, to the Antonelli, Terry, Stout & Kraus, LLP Deposit Account No. 01-2135 (Docket No. 1270.43264X00), and please credit any excess fees to such Deposit Account.

Respectfully submitted,

ANTONELLI, TERRY, STOUT & KRAUS, LLP

WHAT IS CLAIMED IS:

1. A photosensitive resin composition comprising:

(A) a heat-resistant polymer represented by general formula (1)

where X represents a divalent organic group; Y represents a tetravalent organic group; Z represents a cyclic compound group free of reactive unsaturated bonds; R represents hydrogen or a monovalent organic group; and n is an integer of 2 to 500 and represents the number of repeating units of the polymer;

(B) a photoreactive compound; and

(C) a solvent.

2. The photosensitive resin composition according to claim 1, wherein at least one of the organic groups X and Y is an aromatic group.

3. The photosensitive resin composition according to claim 1, wherein the cyclic compound group Z is a compound group having an alicyclic structure.

4. The photosensitive resin composition according to claim 2, wherein the cyclic compound group Z is a compound group having an alicyclic structure.
- 5 5. The photosensitive resin composition according to claim 3, wherein the compound group having an alicyclic structure has 3 or 4 carbon atoms.
6. The photosensitive resin composition according to claim 4, wherein the compound group having an alicyclic structure has 3 or 4 carbon atoms.
- 10 7. The photosensitive resin composition according to claim 1, wherein the divalent organic group represented by X comprises at least one divalent group derived from 3-fluoroisophthalic acid, 2-fluoroisophthalic acid, 3-fluorophthalic acid, 2-fluorophthalic acid, 2,4,5,6-tetrafluoroisophthalic acid, 3,4,5,6-tetrafluorophthalic acid,
- 15 4,4'-hexafluoroisopropylidenediphenyldicarboxylic acid, perfluorosuberic acid, 2,2'-bis(trifluoromethyl)-4,4'-biphenylenedicarboxylic acid, terephthalic acid, isophthalic acid, 4,4'-oxydiphenyldicarboxylic acid, 5-nitroisophthalic acid, 1,4-naphthalenedicarboxylic acid, 2,6-naphthalenedicarboxylic acid, and
- 20 4,4'-biphenyldicarboxylic acid.
8. The photosensitive resin composition according to claim 1, wherein the tetravalent organic group represented by Y comprises at least one divalent group derived from 4,4'-diamino-3,3'-dihydroxybiphenyl,
- 25 2,2'-bis(3-amino-4-hydroxyphenyl)propane, and

2,2'-bis(3-amino-4-hydroxyphenyl)hexafluoropropane.

9. The photosensitive resin composition according to claim 1, wherein Z comprises at least one group selected from the group consisting of
5 cyclopropyl, cyclobutyl, 2-phenyl-1-cyclopropyl, 1-phenyl-1-cyclopropyl, 1-benzocyclobutenyl, 2-methylcyclopropenyl, 1-hydroxy-1-cyclopropyl, 1-carboxy-1-cyclopropyl, and 1-carboxy-1-cyclobutyl.
10. The photosensitive resin composition according to claim 1, wherein
10 the heat-resistant polymer has a weight average molecular weight in the range of 5,000 to 80,000.
11. A process for forming a relief pattern, comprising:
applying the photosensitive resin composition according to claim 1 to
15 a support substrate and drying the composition applied to form a photosensitive resin film;
subjecting the dried photosensitive resin film to exposure;
subjecting the exposed photosensitive resin film to development using an alkaline aqueous solution; and
20 subjecting the developed photosensitive resin film to heating treatment.
12. An electronic component having an electronic device including at least an interlayer dielectric film layer and a surface protecting film layer,
25 wherein at least one of the interlayer dielectric film layer and the

surface protecting film layer comprises a resin film formed from the
photosensitive resin composition according to claim 1.

13. The electronic device according to claim 12, wherein the resin film
5 comprises a patterned film formed by the process according to claim 11.

AB A photosensitive resin compn. is disclosed that includes (A) a heat-resistant polymer of I (X =divalent org. group; Y = tetravalent org. group; Z =cyclic compd. group free of reactive unsatd. bonds; R = H, monovalent org. group; n = 2-500), (B) a photoreactive compd., and (C) a solvent. A relief pattern is formed from the compn. by applying the compn. to a support substrate and drying it to form a photosensitive resin film; exposing the dried film; developing the exposed film using an alk. aq. soln.; and heating the developed photosensitive resin film. Also disclosed is an electronic component that includes an electronic device having such a pattern.

L48 ANSWER 6 OF 13 HCA COPYRIGHT 2004 ACS on STN

139:277708 Polybenzoxazole-based electrically insulating materials, their varnish, heat-resistant porous insulator films, and semiconductor devices having them. Hase, Yoko; Enoki, Naoshi (Sumitomo Bakelite Co., Ltd., Japan). Jpn. Kokai Tokkyo Koho JP 2003/277508 A2 20031002, 24 pp. (Japanese). CODEN: JKXXAF. APPLICATION: JP 2002-87069 20020326.

AB The insulating materials are manufd. by reacting (A) polyamides having branches, which are formed by reacting bisaminophenols and trifunctional carboxylic acids selected from trimellitic acid, trimesic acid, 1,3,5-cyclohexanetricarboxylic acid, and biphenyl ether-3,3',5-tricarboxylic acid, and (B) oligomers having functional groups reactive to carboxy, amino, or OH groups in the polyamides. The polyamides have repeating units of $[NHX(OH)2NHC(O)YCO]_m$ and $[NHX(OH)2NHC(O)ZCO]_n$ [X = tetravalent groups based on benzene, biphenyl, fluorene, etc.; Y = biphenylenylene, acetylene-contg. phenylene, biphenylene, naphthylene, cyclohexylene, etc.; Z = phenylene, biphenylene, fluorenylene, cyclohexylene, etc.; $m > 0$; $n \geq 0$; $m + n = 2-1000$; $m/(m + n) = 0.05-1$]. Thus, 3,3'-diamino-4,4'-dihydroxybiphenyl, trimesic acid trichloride, 5-phenylethynylisophthalic acid, and 5-ethynylisophthalic acid were polymd., reacted with polypropylene glycol bis(2-aminopropyl) ether, dissolved in N-methyl-2-pyrrolidone, applied on an Al-deposited Si wafer, baked, and heated for forming micropores by decomp. polyoxyalkylene portions to give a porous polybenzoxazole film showing dielec. const. 1.90, $T_g > 450$.degree., and water absorption 0.2%.

136:103176 Photo-sensitive polybenzoxazole precursor resins and alkali-developable compositions useful for lithographic patterning containing them. Kaneda, Takayuki; Kimura, Masashi; Kanaya, Ryuichiro (Asahi Chemical Industry Co., Ltd., Japan). Jpn. Kokai Tokkyo Koho JP 2002012665 A2 20020115, 21 pp. (Japanese). CODEN: JKXXAF. APPLICATION: JP 2000-335097 20001101. PRIORITY: JP 2000-130480 20000428.

AB The resins are obtained from the reaction products of a polyamide bearing OH groups partially with OCN(CH₂)_mOCOC(R₁):CR₂R₃ (R₁-3 = H, Cl-3 aliph. groups; m = 2-10), and used in compns. contg. photoinitiators, crosslinkers and diluents for neg.-working photoresists in patterning of semiconductor devices. Thus, condensing 2,2-bis(3-amino-4-hydroxyphenyl)hexafluoropropane with 4,4'-diphenyl ether dicarboxylic acid dichloride, end-blocking the resulting polyamide with phthalic anhydride, purifying, and reacting

the blocked product with 2-isocyanatoethyl methacrylate (at an amt. equiv. to 40 mol% of OH groups on the product) gave a polybenzoxazole precursor 100 parts of which was combined with tetraethylene glycol dimethacrylate 40, 1-phenyl-propanedione-2-(o-benzoyl) oxime 6, Michler's ketone 2, 3-aminopropyltrimethoxysilane 6, N-nitrosodiphenylamine 0.1 and N-methyl-2-pyrrolidone 230 parts to give a neg.-working photoresist with good light curability and developing property by alkali.

L48 ANSWER 13 OF 13 HCA COPYRIGHT 2004 ACS on STN
 125:277261 Design, preparation and characterization of thermotropic liquid crystal polyamides. Alder, P.; Dolden, J. G. (BP Res. Centre, Middlesex, TW16 7LN, UK). High Performance Polymers, 8(3),

433-444 (English) 1996. CODEN: HPPOEX. ISSN: 0954-0083.

Publisher: Institute of Physics Publishing.

AB In this paper, the authors set out to synthesize novel amorphous wholly arom. and semi-arom. thermotropic polyamides. As cryst. arom. polyamides are normally infusible, it was necessary to ensure that the target polyamides were amorphous with a definable softening point below their temp. of decompn. The 'Symmetry Index' approach first developed by Dolden was used to ensure that the chosen monomer compns. were able to produce amorphous polyamides. Aharoni has reported that three amide linked arom. rings is the min. unit size needed to obtain mesogenic polyamides. Building on this principle, a new empirical predictive technique called the 'Mesogenic Index' is introduced and combined with the Symmetry Index to predict polyamides which are both amorphous and thermotropic. This approach was validated by the prepn. of a whole new series of thermotropic amorphous polyamides which were based on 3,3'-dimethoxybenzidine, and the acid chlorides of terephthalic, isophthalic and adipic acids. Furthermore, this led on to the prepn. of two more series of amorphous polyamides, believed by the authors to be the first wholly arom. thermotropic polyamides to be reported, based on 3,3'-dimethoxy and 3,3'-dimethyl benzidine in conjunction with a variety of arom. and cyclic diacids.
